

Sign Rules

for Adding Integers

If both signs are positive.

Rule: The final sign stays the same when the numbers are added	Example
    	$4 + 8 = 12$

If both signs are negative.

Rule: The final sign stays the same when the numbers are added	Example
    	$(-4) + (-8) = -12$

If both signs are different.

Rule: The final sign takes the sign of the larger number when added	Example
    	$8 + (-4) = 4$
    	$(-8) + 4 = -4$

Sign Rules

for Subtracting Integers

If both signs are positive.

Rule: The final sign remains the same when the first number is larger than the second.	Example
	$8 - 4 = 4$

Rule: The final sign becomes negative when the first number is smaller than the second.	Example
	$4 - 8 = -4$

If both signs are negative.

Rule: The final sign remains the same when the first number is larger than the second.	Example
	$(-8) - (-4) = -4$

Rule: The final sign becomes positive when the first number is smaller than the second.	Example
	$(-4) - (-8) = 4$

Sign Rules

for Subtracting Integers

If both signs are different AND the first number is larger than the second number.

Rule: The final sign takes the sign of the first number when subtracted.	Example
   = 	$8 - (-4) = 12$
   = 	$(-8) - 4 = -12$

If both signs are different AND the first number is smaller than the second number.

Rule: The final sign takes the sign of the first number when subtracted.	Example
   = 	$4 - (-8) = 12$
   = 	$(-4) - 8 = -12$
